### **DETAILED ACTION**

The preliminary amendment filed 12/10/2003 has been entered.

#### ***Priority***

Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

#### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Carr et al (US 4,927,268), and further in view of Schulz et al (US 5,513,006).

Carr teaches a system for optical analysis of particles (see col. 3, lines 44-68, col. 2, lines 1-60) that convergently irradiates two specific wavelengths onto a sample using a converging lens 12, passing through a thermal lens generated by convergent radiation of the exciting light, comprising an optical fiber 10 for guiding the two specific wavelengths to the converging lens. The patent does not specifically call the wavelengths as exciting and detecting light; however, it mentions that the wavelengths could be introduced into the fiber by a suitable fiber coupler (see col. 3, lines 45-57). Schulz teaches a photo-thermal sensor for determining the concentration of a sample

by using an excitation light 4 and a probe light 3 for producing the light 21 (emitted by the excitation light source) and light 20 (emitted by the probe light source) (see Fig. 2). It would have been obvious to have two different light sources on the invention of Carr, since the two light sources would have produced two different wavelengths, as it is desired in the Carr's invention. The converging lens in the Carr's invention is a gradient index lens; the two wavelengths passing through the converging lens have different focal positions. Carr does not disclose moving means for moving the optical fiber, however it would have been obvious to move the fiber in order to measure the sample at different locations and make the measurements more efficient.

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Hiraga et al teach an optical method and control. Morris et al teach a photothermal desintometer.
